

Appendix 9. Dendrogram of CTP corpus control words

Note that the x-axis in this figure represents the relative distances between clusters. There is no unit, in the sense of centimeters or inches, because the figure is representing distance in the abstract vector space defined by the corpus. To take an example, the terms “down” and “up” (bottom of y-axis) split at approximately 0.45, whereas “long” splits from the “down” / “up” pair at around 0.9. This means that, within the matrix of the corpus, “down” and “up” are (roughly) twice as close to one another as the pair of them is to “long.”
